

INSTRUCTIONS: With a rifle that is at ambient temperature, set Scope elevation and windage turrets to 0.0. Hold center of the left square and fire one round, then transition to the right square and fire four rounds, again holding center. DO NOT MAKE ANY CORRECTIONS TO YOUR DATA OR HOLD DURING THIS SEQUENCE. Use the grid to measure the deviation between your first shot from center and the four round group from center. This difference between the two is your cold bore data correction.

Cold Bore Target

Each square equals .1 mil at 100 yards
